

CSS332: Microcontrollers and Applications

Final Mock Exam

curated by The Peanuts

Name...Nonprawich I...ID...6622772422...Section...4...No...☺...

Conditions: Semi-Closed Book (A4 Both Sides)

Directions:

1. This exam has 15 pages (including this page).
2. Calculators (Casio 991 Series) are allowed.
3. Write your name clearly at the top of each page.
4. You may cry silently. Loud sobs will be graded as participation.
5. If you finish early, triple-check your work.
6. Do not cheat.
7. Good luck! May the bugs forever stay in your code and not in your answers.

^{Rock?}
~~For solution, [click here](#).~~

Problem 1

You need to write an Assembly program to implement the following tasks:

- Task 1: The microcontroller monitors the status of the switch SW: if SW is pressed, LED0 turns on; if not pressed, LED0 turns off.
- Task 2: The microcontroller keeps turning LED1 on and off every 0.5 seconds using the Timer0 overflow interrupt.

The Timer0 should be set up in normal mode with a pre-scaling factor of 1024. Each Timer0 overflow will generate an interrupt every 4000 μ s.

Part A: Timer Calculations

- a) What value should be loaded into TCNT0 to generate an overflow interrupt every 4000 μ s with a 16 MHz clock and a prescaler of 1024?

$$4000 = \left[\left(\left\lceil \frac{(255 - A + 1) \times 1024}{3} \right\rceil \times 3 \right) + 2 + 14 \right] \times 0.0625$$

$$A = 193.51$$

$$A \approx 194 = 0xC2$$

$$\therefore \text{TCNT0} = 0xC2$$

- b) How many Timer0 overflow interrupts are required to achieve the 0.5-second toggle for LED1?

$$\# \text{loops} = \frac{0.5}{4000 \times 10^{-6}} = 125$$

Part B: Complete the Assembly Program

Complete the following Assembly program by filling in the missing parts to implement both tasks.

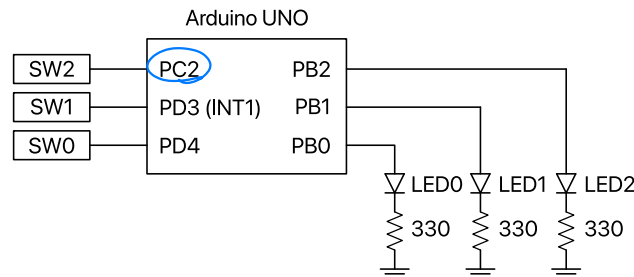

```

```

Problem 2

You need to write a C program to implement the following tasks:

- Task 1: The microcontroller monitors the status of switch SW0: if SW0 is pressed, LED0 turns on; if not pressed, LED0 turns off.
- Task 2: The microcontroller monitors the status of switch SW1 (connected to INT1): if SW1 is pressed, LED1 toggles (on → off or off → on). The INT1 should be configured for rising-edge trigger.
- Task 3: The microcontroller monitors the status of switch SW2 (connected to PC2): LED2 toggles only after SW2 has been pressed and released 4 times (using the pin change interrupt).

Main program

Part A: Interrupt Configuration

- a) For INT1 (external interrupt) with rising-edge trigger, what values should be configured for the following registers?

EIMSK = 0x02

EICRA = 0x0C

- b) For the pin change interrupt on PC2, what values should be configured for the following registers?

PCICR = 0x02

PCMSK0 = 0x00

PCMSK1 = 0x04

PCMSK2 = 0x00

- c) To make LED2 toggle only after 4 button presses on SW2, what initial value should variable z be set to? Explain your answer.

Part B: Complete the C Program

Complete the following C program to implement all three tasks. Fill in the blanks with appropriate code.

```
1  #include <avr/io.h>
2  #include <avr/interrupt.h>
3
4  unsigned char z = _8_; // Initial value for counting SW2 presses
5
6  void PIN_SETUP() {
7      // Configure LED outputs
8      DDRB |= (1<<0); // Set PB0 as output for LED0
9      PORTB &= ~(1<<0); // Set PB0 initial state to low
10     DDRB |= (1<<1); // Set PB1 as output for LED1
11     PORTB &= ~(1<<1); // Set PB1 initial state to low
12     DDRB |= (1<<2); // Set PB2 as output for LED2
13     PORTB &= ~(1<<2); // Set PB2 initial state to low
14
15     // Configure switch inputs with pull-up resistors
16     DDRD &= ~(1<<4); // Set PD4 as input for SW0
17     PORTD |= (1<<4); // Enable pull-up for PD4
18     DDRD &= ~(1<<3); // Set PD3 as input for SW1 (INT1)
19     PORTD |= (1<<3); // Enable pull-up for PD3
20     DDRC &= ~(1<<2); // Set PC2 as input for SW2
21     PORTC |= (1<<2); // Enable pull-up for PC2
22 }
23
24 int main() {
25     PIN_SETUP();
26 }
```

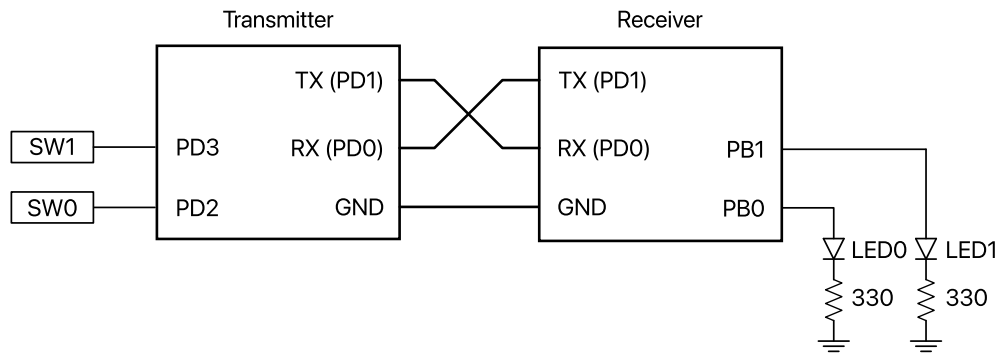

```

27 // Configure INT1 for rising edge trigger
28 EIMSK = 0x02; // Enable INT1
29 EICRA = 0x0C; // Set for rising edge
30
31 // Configure Pin Change Interrupt for PC2
32 PCICR = 0x02; // Enable PORTC pin change interrupts
33 PCMSK1 = 0x04; // Enable interrupt for PC2
34
35 sei(); // Enable global interrupts
36
37 while (1) {
38     if (__PIND & (1<<4)) { // Check if SW0 is pressed
39         PORTB |= (1<<0); // Turn on LED0
40     } else {
41         PORTB &= ~(1<<0); // Turn off LED0
42     }
43 }
44
45 return 0;
46 }
47
48 // ISR for INT1 (Task 2)
49 ISR(INT1_vect) {
50     PORTB ^= (1<<1); // Toggle LED1
51 }
52
53 // ISR for Pin Change Interrupt (Task 3)
54 ISR(PCINT1_vect) {
55     z--; // Decrement counter
56     if (z == 0) {
57         PORTB ^= (1<<2); // Toggle LED2
58         z = 8; // Reset counter to initial value
59     }
60 }

```

Problem 3

In this exercise, you will implement serial communication between two Arduino UNO boards. Board 1 will have two switches connected, while Board 2 will have two LEDs connected. When a switch on Board 1 is pressed, it will send a command through UART to toggle the corresponding LED on Board 2.

Part A: Board 1 - Transmitter

Complete the following C program for Board 1, which will monitor the switch states and send commands to Board 2 when a switch is pressed:

```
1  #include <avr/io.h>
2  #define F_CPU 16000000UL
3  #include <util/delay.h>
4
5  // Function to initialize UART
6  void usart_init(void) {
7      UCSROB = (1<<TXEN0); // Enable USART transmitter
8      UCSROC = (1<<UCSZ01)|(1<<UCSZ00); // Async, 8 bits
9      UBRROL = 103; // Baud rate = 9600
10 }
11
12 void pin_setup(void) {
13     DDRD &= ~(1<<2); // Set PD2 as input (Switch 0)
14     PORTD |= (1<<2); // Enable pull-up for Switch 0
15     DDRD &= ~(1<<3); // Set PD3 as input (Switch 1)
16     PORTD |= (1<<3); // Enable pull-up for Switch 1
17 }
```

```

18 // Function to send a character over UART
19 void usart_send(unsigned char data) {
20     while (!(____)); // Wait until UDR0 is empty
21     UDR0 = data; // Send data
22 }
23
24 int main(void) {
25     pin_setup();
26     usart_init();
27
28     while(1) {
29         // Check if Switch 0 is pressed (PD2 is LOW)
30         if (____!(PIND & (1<<2))____) {
31             usart_send('1'); // Send command to toggle LED0
32             _delay_ms(200);
33         }
34
35         // Check if Switch 1 is pressed (PD3 is LOW)
36         if (____!(PIND & (1<<3))____) {
37             usart_send('2'); // Send command to toggle LED1
38             _delay_ms(200);
39         }
40
41         _delay_ms(50); // Small polling delay
42     }
43
44     return 0;
45 }

```

while (!(USCRA & (1<<UDRE0)));

Part B: Board 2 - Receiver

Complete the following C program for Board 2, which will receive commands from Board 1 and toggle the corresponding LEDs:

```
1 void usart_init(void) {
2     UCSROB = (1<<RXEN0); // Enable USART receiver
3     UCSROC = (1<<UCSZ01)|(1<<UCSZ00); // Async, 8 bits
4     UBRROL = 103; // Baud rate = 9600
5 }
6
7 void pin_setup(void) {
8     DDRB |= (1<<0); // Set PBO as output (LED0)
9     PORTB &= ~(1<<0); // Set LED0 initial state to OFF
10    DDRB |= (1<<1); // Set PB1 as output (LED1)
11    PORTB &= ~(1<<1); // Set LED1 initial state to OFF
12 }
13
14 int main(void) {
15     unsigned char received_data;
16     pin_setup();
17     usart_init();
18
19     while(1) {
20         // Wait until data is received
21         while (!(UCSR0A & (1<<RXCO))); // Check if data is available
22
23         // Read the received data
24         received_data = UDRO;
25
26         // Process received commands
27         if (received_data == '1') {
28             PORTB ^= (1<<0); // Toggle LED0
29         }
30         else if (received_data == '2') {
31             PORTB ^= (1<<1); // Toggle LED1
32         }
33     }
34     return 0;
35 }
```

Part C: Questions

- a) What value should be loaded into UBRRL to achieve a baud rate of 9600 with a 16 MHz clock? Show your calculation.

$$UBRR = \frac{F_{CPU}}{16 \times \text{Baud}} - 1 = \frac{16 \times 10^6}{16 \times 9600} - 1 \approx 103 \#$$

- b) What command (character) should be sent from Board 1 when Switch 0 is pressed to toggle LED0 on Board 2?

'1'

- c) What command (character) should be sent from Board 1 when Switch 1 is pressed to toggle LED1 on Board 2?

'2'

- d) Which pins must be disconnected before uploading code to the Arduino boards? Explain why this is necessary.

Pin PD0 (RX) and PD1 (TX) must be disconnected before uploading code to Arduino
Because these pins are used for serial communication between Arduino and the computer
If they remained connected, it can interfere with the upload process, or preventing code
from being properly uploaded

Problem 4

You need to write a C program to implement a voltage comparator using two analog inputs on the microcontroller. The circuit consists of two potentiometers connected to ADC0 and ADC1 pins, with three LEDs connected to pins PB0, PB1, and PB2.

Write a complete C program that performs the following tasks:

1. Read the voltage values from two potentiometers connected to ADC0 and ADC1 pins.
2. Compare the two voltage values and control LEDs based on these conditions:
 - (a) If voltage at ADC0 > voltage at ADC1, turn on LED1 (PB0) and turn off other LEDs.
 - (b) If voltage at ADC0 < voltage at ADC1, turn on LED2 (PB1) and turn off other LEDs.
 - (c) If voltage at ADC0 = voltage at ADC1, turn on LED3 (PB2) and turn off other LEDs.

Hint: You may need to configure two separate ADC channels in your program. Consider using a function to read the ADC value from a specific channel.

```

#include <avr/io.h>
#define F_CPU 16000000UL
#include <util/delay.h>

// Function to initialize pins
void pin_setup(void) {
    DDRC = 0x00; // Set PORTC as input (ADC0 and ADC1)
    DDRB = 0x07; // Set PB0, PB1, PB2 as outputs (LEDs)
    PORTB = 0x00; // Initialize all LEDs as OFF
}

// Function to initialize ADC0
void ADC0_setup(void) {
    ADCSRA = 0x87; // Enable ADC, set prescaler to 128
    ADMUX = 0x40; // Vref = AVCC, select ADC0 channel, right-justified
}

// Function to initialize ADC1
void ADC1_setup(void) {
    ADCSRA = 0x87; // Enable ADC, set prescaler to 128
    ADMUX = 0x41; // Vref = AVCC, select ADC1 channel, right-justified
}

// Function to read from ADC
int read_ADC(void) {
    ADCSRA |= (1 << ADSC);
    while ((ADCSRA & (1 << ADIF)) == 0);
    return ADC;
}

int main(void) {
    int adc0_value, adc1_value;

    pin_setup();

    while (1) {
        ADC0_setup();
        adc0_value = read_ADC();

        ADC1_setup();
        adc1_value = read_ADC();

        PORTB = 0x00; // Turn off all LEDs

        if (adc0_value > adc1_value) {
            PORTB = 0x01;
        } else if (adc0_value < adc1_value) {
            PORTB = 0x02;
        } else {
            PORTB = 0x04;
        }

        _delay_ms(100);
    }

    return 0;
}

```

Problem 5

In this problem, you will implement the functionality from Problems 1-4 using Arduino programming language (C++ with Arduino libraries) instead of AVR C or Assembly. Select ONE of the previous problems (1-4) and reimplement it using Arduino code.

Random Question Selection:

Visit npw itk.com/css332-random to randomly determine which problem (1-4) you should implement in Arduino.

Problem 1

According to Lecture 13

```
#include <TimerOne.h>

const int switchPin = 2;
const int led0Pin = 9;
const int led1Pin = 10;

// Variable to track LED1 state
volatile boolean led1State = LOW;

void setup() {
    pinMode(led0Pin, OUTPUT);
    pinMode(led1Pin, OUTPUT);

    pinMode(switchPin, INPUT_PULLUP);

    digitalWrite(led0Pin, LOW);
    digitalWrite(led1Pin, LOW);

    // Initialize Timer1 with a period of 0.5 seconds
    Timer1.initialize(500000);
    Timer1.attachInterrupt(toggleLED1);
}

void loop() {
    // Task 1: Monitor switch status
    if (digitalRead(switchPin) == LOW) { // Switch is pressed (LOW because of pull-up resistor)
        digitalWrite(led0Pin, HIGH);    // Turn LED0 on
    } else {
        digitalWrite(led0Pin, LOW);      // Turn LED0 off
    }
}

// Timer interrupt service routine
void toggleLED1() {
    led1State = !led1State;
    digitalWrite(led1Pin, led1State);
}
```

Problem 2 (Unlikely) → ~~Toggle~~ pin change interrupt via Arduino ~~using~~ ^{using} C

Problem 3

Transmitter

```
const int switch0Pin = 2;
const int switch1Pin = 3;

int switch0PrevState = HIGH;
int switch1PrevState = HIGH;

void setup() {
  pinMode(switch0Pin, INPUT_PULLUP);
  pinMode(switch1Pin, INPUT_PULLUP);

  Serial.begin(9600);
}

void loop() {
  int switch0State = digitalRead(switch0Pin);
  int switch1State = digitalRead(switch1Pin);

  if (switch0State == LOW && switch0PrevState == HIGH) {
    Serial.write('1'); // Send '1' character to toggle LED0
    delay(50);
  }

  if (switch1State == LOW && switch1PrevState == HIGH) {
    Serial.write('2'); // Send '2' character to toggle LED1
    delay(50);
  }

  switch0PrevState = switch0State;
  switch1PrevState = switch1State;

  delay(10);
}
```

Receiver

```
const int led0Pin = 8;
const int led1Pin = 9;

boolean led0State = LOW;
boolean led1State = LOW;

void setup() {
  pinMode(led0Pin, OUTPUT);
  pinMode(led1Pin, OUTPUT);

  digitalWrite(led0Pin, led0State); // RESET here
  digitalWrite(led1Pin, led1State);

  Serial.begin(9600);
}

void loop() {
  if (Serial.available() > 0) {

    char receivedChar = Serial.read();

    if (receivedChar == '1') {
      led0State = !led0State;
      digitalWrite(led0Pin, led0State);
    }
    else if (receivedChar == '2') {
      led1State = !led1State;
      digitalWrite(led1Pin, led1State);
    }
  }
}
```

Problem 4 ✖✖ (အမေ့ရတာများများ)

```
const int pot1Pin = A0;    // First potentiometer
const int pot2Pin = A1;    // Second potentiometer
const int led1Pin = 8;     // LED1 (for A0 > A1)
const int led2Pin = 9;     // LED2 (for A0 < A1)
const int led3Pin = 10;    // LED3 (for A0 = A1)

void setup() {
  pinMode(led1Pin, OUTPUT);
  pinMode(led2Pin, OUTPUT);
  pinMode(led3Pin, OUTPUT);

  pinMode(pot1Pin, INPUT); } အချိန်မရှိ
  pinMode(pot2Pin, INPUT);

  digitalWrite(led1Pin, LOW);
  digitalWrite(led2Pin, LOW);
  digitalWrite(led3Pin, LOW);
}

void loop() {
  int pot1Value = analogRead(pot1Pin); // Read from A0 (0-1023)
  int pot2Value = analogRead(pot2Pin); // Read from A1 (0-1023)

  digitalWrite(led1Pin, LOW);
  digitalWrite(led2Pin, LOW);
  digitalWrite(led3Pin, LOW);

  if (pot1Value > pot2Value) {
    digitalWrite(led1Pin, HIGH); // Turn on LED1
  } else if (pot1Value < pot2Value) {
    digitalWrite(led2Pin, HIGH); // Turn on LED2
  } else { // Values are equal
    digitalWrite(led3Pin, HIGH); // Turn on LED3
  }

  delay(100);
}
```
